Art Unit: 2862

1. This communication is in response to applicant's amendment filed on August 11, 2005.

- 2. The abstract of the disclosure is objected to because the abstract does not set forth the nature and gist of the invention. Please note that the invention is directed to measuring internal resistance of the magnetic field sensing element.

 Correction is required. See MPEP § 608.01(b).
- 3. Claims 9 and 16 are objected to because of the following informalities:

 In claims 9,16, the scope of the claim is not clear since it is vague as to what type of calculation is performed to determine the correction factor.

 Appropriate correction is required.
- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Application/Control Number: 10/728,824

Art Unit: 2862

Claims 7-9,12-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over McMaster et al. (3,359,495) in view of Miekley (5,818,225).

As to claims 7-8,14-15, McMaster discloses a measuring device for coating thickness using a magnetic sensor element as measuring device. McMaster fails to disclose for temperature compensation in the signal in a measuring device. Miekley discloses that it is known in the art that the resistance of the magnetic field sensing element is dependent on the temperature and can be used to measure the temperature (see abstract). Miekley also discloses that it is known in that art that the temperature coefficient of the magnetic sensor element is one of the important properties of the sensing element in determining the temperature (Note e.g. col. 1, lines 14+). These properties, resistance and temperature coefficient, of the magnetic field sensing elements are known to use for temperature compensation. Consequently, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the device of McMaster to use these properties of the sensing element as taught by Miekley to measure the temperature and to compensate the output signal for temperature compensation.

As to claims 9,16, the correction of the measured output voltage in Miekley is performed by calculation.

Application/Control Number: 10/728,824

Art Unit: 2862

As to claims 12-13,17-18, the magnetic sensing element in McMaster or Miekley is Hall sensor element. McMaster teaches that Hall sensor can be replaced by MR (col. 4, line 68).

5. Applicant's arguments with respect to claims 7-9,12-13 have been considered but are moot in view of the new ground(s) of rejection.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jay M. Patidar whose telephone number is 571-272-2265. The examiner can normally be reached on M-Thur 7:00-5:30.

The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
